this volume focuses squarely on the fact that as a result of a wide range of advances over recent years increasingly many specialists in the biology of aging are revising their traditional view that mammalian aging will remain essentially immutable for many decades to come this is exemplified by three carefully argued analyses of the current state of biomedical gerontology published recently by a variety of experts in fields spanning most major aspects of mammalian aging we are therefore at an unprecedented turning point in the study of aging in which the curiosity driven exploratory research that has justifiably monopolized the field until now can at last be legitimately accompanied by goal directed biotechnological efforts rationally designed on the basis of solid scientific knowledge the purpose of this volume is to consolidate that advance by making those at the forefront of each aspect of aging and its control more aware of each other s work and by drawing attention to the comprehensiveness and therefore the potential efficacy of foreseeable anti aging biotechnology
