illustrated 1883 edition excerpt chapter vi temperature the earliest varieties of the vine require about five months to ripen their fruit from the time of starting the vines but kinds like the black hampshire are better allowed six months late varieties like the muscat of alexandria gros guillaume and others mentioned in the list of late grapes at the end require nearly eight months but the alicante and lady downes can be ripened perfectly between the beginning of april and the end of october grape growers have therefore only to calculate when they will need any given crops to be ripe and start their vineries accordingly before starting the vines they should be washed and cleaned and so should any portion of the vinery inside the border should also receive a good watering as regards temperature a few noteworthy fruit growers allow considerable latitude preferring rather to be guided by circumstances and weather conditions than by hard and fast rules with the vine however in the earlier stages of forcing unnaturally not to say injuriously high night temperatures have been the rule hitherto but a great change has taken place of late years in favour of lower temperatures as being both better for the vines and more economical if we compare the night temperatures generally recommended for the vine from the starting period till the setting of the fruit it will be found that they far exceed the average night temperature during the same period of growth in those countries most favourable to the vine and what makes the matter worse these excessively high temperatures are given under circumstances which only increase their power of mischief as for instance when the vine is forced in a vinery under our cloudy skies and during the long dark

information on the evolution taxonomy morphology anatomy physiology and genetics of grapevines has been scarce and thinly spread in the literature on horticulture and the plant sciences this book aims to provide a concise but comprehensive overview of the biology and cultivation of the grapevine accessible to all concerned with viticulture after a description of the essential features of viticulture including a concise history from antiquity to modern times the taxonomy of the grapevine and the evolutionary processes which gave rise to the diversity within the vitaceae is considered particular attention is paid to the genera vitis and muscadinia which are considered a reserve of genetic variation for the improvement of grapevines a description of the vegetative and reproductive anatomy of the grapevine precedes a full discussion of the developmental and environmental physiology of these fascinating and economically important plants the concluding chapter considers the potential for genetic improvement of grapevines and includes coverage of the problems encountered and the methods and strategies employed in breeding for scions and rootstocks

the domestication of grapes dates back five thousand years ago and has spread to nearly all continents in recent years grape acreage has increased dramatically in new regions including the united states of america chile asia china and india and turkey a major limiting factor to the sustained production of premium grapes and wines is infections by viruses the advent of powerful molecular and metagenomics technologies such as molecular cloning and next generation sequencing allowed the discovery of new viruses from grapes to date grapevine is susceptible to 64 viruses that belong to highly diverse taxonomic groups the most damaging
