reef fish spawning aggregations ranging from small groups to many tens of thousands of individuals are spectacular but poorly known natural phenomena whereby fish assemble at specific times and locations to spawn for some species these large groups may be the only form of reproduction the high fish numbers briefly giving a false impression of stability and abundance an illusion of plenty they are often a focus for intensive seasonal fishing because of their predictability and because many important commercial fishes form them highly vulnerable to overexploitation many aggregations and their associated fisheries have disappeared or are in decline few are effectively managed or incorporated into protected areas aggregations are not well understood by fishery scientists managers and conservationists and their significance little appreciated by fishers or the wider public to ensure their persistence to replenish important fisheries in coral ecosystems maintain their ecosystem function and continue to delight divers a significant change in perspective is needed to foster protection and management this book provides comprehensive and practical coverage of the biology study and management of reef fish aggregations exploring their how when where and why it explores ways to better protect study manage and conserve them while identifying key data gaps and questions the text is extensively illustrated with many unique never before published photographs and graphics case studies on over 20 interesting and important fishes are included outlining their biology and fisheries and highlighting major concerns and challenges

salvelinus species are one of the most thoroughly studied groups of fishes many reasons explain this intense interest in charr biology charrs have a holarctic distribution encompassing many asian north american and european countries and occupy diverse marine and freshwater environments furthermore the current distribution of charr includes areas that were directly influenced by climate and topographic change associated with the many pleistocene glaciations

undoubtedly these conditions have promoted much of the tremendous morphological ecological and genetic variability and plasticity within salvelinus species and they make charr very good models to study evolutionary processes in action many charr species also exhibit demographic characteristics such as slow growth late maturity and life in extreme environments that may increase their susceptibility to extinction from habitat changes and overexploitation especially in depauperate aquatic habitats this vulnerability makes understanding their biology of great relevance to biodiversity and conservation finally charr are of great cultural commercial and recreational significance to many communities and their intimate linkage with human societies has stimulated much interest in this enigmatic genus this volume comprises a selection of papers presented at the fourth international charr symposium held in trois rivières québec canada from 26 june to 1 july 2000 it includes 31 papers on ecological interactions and behaviour trophic polymorphism movement and migration ecophysiology and evolutionary genetics ecological parasitology environmental stress and conservation these studies cannot cover all recent developments in the ecology behaviour and conservation of salvelinus species but collecting them into a special volume should bring attention to current research on this important genus and stimulate further work on salvelinus species
