this article is dedicated to claudio bunster on the occasion of his 60th birthday it is a great honor to take this opportunity to express my gratitude to him who in my opinion has been the greatest national physicist ever for his wise guidance and intrepid support through the years as a chilean i can further tell that claudio s contributions have been well far beyond theoretical physics helping our country to be ready to face future challenges through science gravity in diverse dimensions is a subject in which claudio has done major c tributions encouraging in many ways the following work that is being made along different fronts in collaboration with my colleagues diego correa gustavo dottti julio oliva and david tempo thepursuitforwormholesolutions whicharehandlesinthespacetime topology it is as old as general relativity and it has appeared in theoretical physics within different subjects ranging from the attempt of describing physics as pure geometry as in the einstein rosen bridge model of a particle 1 to the concept of charge withoutcharge 2 aswell

as different issues concerning the euclidean approach to quantum gravity see e.g. 3 more recently the systematic study of this kind of objects was pushed forward by the works of morris thorne and yurtsever 4 5

this volume has become one of the modern classics of relativity theory when it was written in 1983 there was little physical evidence for the existence of black holes recent discoveries have only served to underscore the elegant theory developed here and the book remains one of the clearest statements of the relevant mathematics

this volume offers an integrated understanding of how the theory of general relativity gained momentum after einstein had formulated it in 1915 chapters focus on the early reception of the theory in physics and philosophy and on the systematic questions that emerged shortly after einstein's momentous discovery they are written by physicists historians of science and philosophers and were originally presented at the conference titled thinking about space and time 100 years of applying and interpreting general relativity held at the university of bern from september 12-14 2017 by establishing the historical context first and then moving into more philosophical chapters this volume will provide readers with a more complete understanding of early applications of general relativity e.g. to cosmology and of related philosophical issues because the chapters are often cross disciplinary they cover a wide variety of topics related to the general theory of relativity these include heuristics used in the discovery of general relativity mach's principle the structure of einstein's theory cosmology and the einstein world stability of cosmological models the metaphysical nature of spacetime the relationship between spacetime and dynamics the geodesic principle symmetries thinking about space and time will be a valuable resource for historians of science and philosophers who seek a deeper knowledge of the early and later uses of general relativity as well as for physicists and mathematicians interested in exploring the wider historical and philosophical context of einstein's theory

what is time the janus point offers a ground breaking solution to one of the greatest mysteries in physics for over a century the greatest minds have sought to understand why time seems to flow in one direction ever forward in the janus point julian barbour offers a radically new answer it doesn't at the heart of this book barbour provides a new vision of the big bang the janus point from which time flows in two directions its currents driven by the expansion of the universe and the growth of order in the galaxies planets and life itself what emerges is not just a revolutionary new theory of time but a hopeful argument about the destiny of our universe both a work of literature and a masterpiece of scientific thought lee smolin author of the trouble with physics profound original accessible to anyone who has pondered the mysteries of space and time martin rees astronomer royal takes on fundamental questions offering a new perspective on how the universe started and where it may be headed science magazine

this book provides a thorough and up to date introduction to the philosophy of quantum physics although quantum theory is renowned for its spectacular empirical successes controversial discussion about how it should be understood continue to rage today in this volume the authors provide an overview of its numerous philosophical challenges do quantum objects violate the principle of causality are particles of the same type indistinguishable and therefore not individual entities do quantum objects retain their identity over time how does a compound quantum system relate to its parts these questions are answered here within different interpretational approaches to quantum theory finally moving to quantum field theory we find that the problem of non locality is exacerbated philosophy of quantum physics is aimed at philosophers with an interest in physics while also serving to familiarize physicists with many of the essential philosophical questions of their subject

this detailed survey comprises reprints on subjects related to the development of quantum cosmology as an introduction an overview is included

examined are recent astronomical findings and developments in theoretical cosmology in order to better understand three broad questions was the universe created is the cosmos designed are we alone the questions are addressed by a broad spectrum of scholars including astronomers cosmologists philosophers and religious scholars who examine the three questions in terms of humanity s place within the universe

this text addresses the problems of complex systems in understanding natural phenomena and the behaviour of systems related to human activity from a science and humanities perspective it discusses molecular behaviour and structures and offers examples of ecological and environmental modelling

this work combines the work of field theorists and general relativists it features traditional domains of interaction such as perturbation theory and explores future topics such as measurement theory string field theory and hidden symmetries for extended objects
