Supply chain management (SCM) has been stressed as a remedy to many of the underlying issues in the construction industry; however, the positive examples where SCM has been successfully utilised and diminished the lingering issues in construction are scarce. The question is why previous studies have stressed the importance of planning both the construction project as such but also the supply chain and the logistics as an important part of SCM. Supply chain planning (SCP) focuses on planning different aspects of the supply chain through involving different members of the supply chain in the planning process. SCP in construction is scarce as the planning of the logistics in general failing to plan the supply chain involving supply chain members in the planning and integrating the processes of planning the supply chains and the construction project can be one reason for the low numbers of successful SCM adoption in construction. In improving the SCP in construction, this thesis develops a SCP framework for construction that involves the main contractor, subcontractors, and suppliers. The aim is to improve SCP collaboration and eliminate many of the common problems in construction through a SCM and SCP perspective. The developed framework is based on an existing planning framework for sales and operations planning. This framework is generic and synthesises planning in general. It consists of identifying developing outcomes, input organisation process, key performance measurements, and IT tools. It is thus necessary to investigate what these aspects mean in a construction context. Four research objects will be fulfilled: Objective 1: identify common logistical problems and linkages between them; Objective 2: develop a SCP process; Objective 3: develop a SCP organisation; Objective 4: identify performance measurements.
