since the sixth edition of this classic text reference was published in 1981 there have been so many developments in the field that the new seventh edition represents an almost total rewrite of the subject matter the opportunity has been taken to rearrange the structure and broaden the scope to cover areas of conversion machining and the application of paints and finishes the format has also been enlarged to improve readability part 1 contains chapters that deal with the structure of wood at the gross cellular and molecular levels variability is also covered part 2 has five chapters

on the properties of wood with special coverage of elastic behaviour toughness and the use of structural sized timber for strength tests part 3 on processing has material on several new areas not covered in earlier editions of the book for example log conversion seasoning and the machining of wood and board the discussion of grading and grade stresses is fully updated part 4 on utilisation examines the latest techniques and standards for the manufacture of wood products part 5 examines all aspects of timber in service including protection and preservation the book will appeal to a wide readership both as a student text and reference students of wood science and forestry at undergraduate and equivalent level will find it of special value all institutions with courses in the built environment will wish to make the book available as a reference source

timber is one of the oldest of man's building materials but because the building scene today is dominated by concrete and steel many designers are unfamiliar with the properties of timber and its structural vocabulary this new book begins with an extended introduction to timber as a building material its various forms and properties its response to environmental conditions and the building regulations relating to its use it goes on to follow the general sequence of work starting with the commission and then dealing with the survey the investigation and the appraisal

timber construction is one of the most prevalent methods of constructing buildings in north america and an increasingly significant method of construction in europe and the rest of the world timber engineering deals not only with the structural aspects of timber construction structural components joints and systems based on solid timber and engineered wood products but also material behaviour and properties on a wood element level produced by internationally renowned experts in the field this book represents the state of the art in research on the understanding of the material behaviour of solid wood and engineered wood products there is no comparable compendium currently available on the topic the subjects represented include the most recent phenomena of timber engineering and the newest development of practice related research grouped into three different sections basic properties of wood based structural elements design aspects on timber structures and joints and structural assemblies this book focuses on key issues in the understanding of timber as a modern engineered construction material with controlled and documented properties the background for design of structural systems based on timber and engineered wood products the background for structural design of joints in structural timber systems furthermore this invaluable book contains advanced teaching material for all technical schools and universities involved in timber engineering it also provides an essential resource for timber engineering students and researchers as well as practicing structural and civil engineers

timber the old raw material and building material returns there are many reasons today for building with wood and there are great advantages over conventional designs wood is not only a renewable building material that helps reduce the levels of co<sub>2</sub> and is hence good for climate change but due to modern computing and manufacturing processes it can also be used for a variety of construction tasks wood possesses excellent

qualities for both construction and indoor climate control and can easily be combined with other common building materials based on 24 international projects the book provides an overview of the range of possibilities in wood construction today texts images and plans document the architectural and constructive qualities of contemporary timber structures from the conceptual design to the structure in detail the various uses are based on current research in modern timber engineering but also on timber construction expertise that has been developing over many centuries this special discipline has evolved significantly in recent decades particularly in germany austria and switzerland and is a world leader today

wood is usually perceived as a traditional material however the properties of this material have now for some time made it possible to design free shapes and highly complex structures today the wood laboratory of the epf lausanne which was originally founded by julius natterer is testing the production of origami structures ribbed shells fabric structures and curved panels under the guidance of professor weinand using digital calculation and computer aided processing methods the research results are tested in prototypes which demonstrate the potential applications in large scale timber buildings by exploring the hitherto unused potential of wood as a construction material this book provides an exciting and inspiring outlook on a new generation of timber buildings

this book contains papers presented at the 1st international conference on timber structures which was held in collaboration with the technical centre of wood industry in belgium it explores the latest developments in wood products and their application as structural components the focus of the included works is to draw attention to new research and real applications from both researchers and practitioners and to present new and innovative ideas in this significant field rapid advances have recently been made in the development and processing of innovative ecologically friendly wood products a variation of new structural shapes can now be fabricated and used to construct buildings and bridges which have minimal impact on the environment wood is particularly appealing since it is renewable and has no carbon footprint when it is harvested in a sustainable way timber structures are ecologically sound and comparatively low cost the material lends itself to ground breaking designs and new types of composites offer reliable robust and safe materials the content of this book comprises a range of topics material properties of wood durability aspects service life modelling fire safety of timber structures protection against decay non destructive inspection and monitoring glued laminated structures xlam and clt timber joints and connections vernacular wood and heritage timber structures timber housing and eco architecture timber bridges large span timber roof structures shell structures in timber mixed composite and hybrid structures computational analysis and experimental methods structural engineering and design seismic behaviour of timber structures protection of timber repaired timber structures rapidly assembled and transferable timber structures guidelines codes and regulations structural failures art and craftsmanship

this classic text on wood design incorporates the 1997 national design specifications for wood construction and being released later this year by the american forest and paper association and including the 1997 uniform building code and the latest information on loading criteria and lateral forces wind and earthquake design the focus of the revision will be on allowable stress design and with the load resistance factor design to be published in the future

this report is a publication developed within the european network cost action fp 1101 assessment reinforcement and monitoring of timber structures the main aim of the report is to summarise the current and emerging methods that are available to repair or enhance the structural performance of timber structures and to provide guidance to the use of these methods the report is organised in two main parts in part i the different structural elements and subsystems that make up our buildings are considered these include beams floors columns shear walls and connections the possible failure modes are described and the appropriate reinforcement strategies for each case are presented including consideration of cultural heritage issues the reinforcement of buildings to increase their resistance to seismic actions is also included in this part the focus of part ii is on reinforcement materials and methods these include adhesive systems mechanical fasteners such as glued in rods and self tapping screws fibre reinforced polymer laminates and bars and emerging nano structured materials the properties of these materials their methods of application and relevant design rules are described the report provides details not only of the latest research findings related to the reinforcement of timber structures but most importantly how these methods can be best used in practice many examples are given of the implementation of the various reinforcement methods because of this the report will be of interest not only to the research community relevant standardisation bodies and policy makers but also to practitioners representatives of the timber construction industry and product developers in the sector of reinforcement technologies

wood is one of the most intriguing structural materials and the only one that is truly renewable along with stone wood is the oldest structural material on the planet and has been extensively used throughout human history due to its aesthetical value and positive environmental impact wood has experienced a renaissance in construction as a biodegradable hygroscopic non isotropic material wood presents special challenges for a professional and requires through knowledge ranging from biology to continuum mechanics this state of the art report reflects the current knowledge in the area of in situ assessment of the physical and mechanical properties of wood structures nondestructive semi destructive and destructive methods are described in a systematic manner where technology equipment and limitations are discussed some of the discussed methods are used in other materials such as masonry and concrete most of the methods however are specific to wood and special qualifications are required to understand and apply these methods effectively existing methods are constantly improved and new methods are being developed this report includes methods that are used in practice or have shown significant promise and have a body of knowledge that supports statements

made in this report this is a useable tool for professionals researchers educators and students

an indispensable standard work for everyone involved in building with wood this work uses plans schematic drawings and pictures to show the current and forward looking state of the technology as applied in Switzerland a leading country in the field of timber construction

this standard sets out limit state design methods for the structural use of timber which are based on the principles of structural mechanics and on data established by research the standard is intended for use in the design or appraisal of structural elements or systems comprised of timber or wood products and of structures comprised substantially of timber to this end it provides design data for sawn timber laminated timber timber in pole form plywood laminated veneer lumber and various types of fastenings in addition it provides methods of test for components or assemblies of unconventional design which may not be readily amenable to detailed analysis

solid accessible coverage of the basics of wood structure design this invaluable guide provides a complete and practical introduction to the design of wood structures for buildings written to be easily understood by readers with limited experience in engineering mechanics structural analysis or advanced mathematics the book includes a comprehensive review of structural properties including density elasticity defects lumber gradings and use classification a straightforward discussion of design methods and criteria stress strength design values loading bracing and more extensive material on wood sections from beam functions behavior and design to wood decks and wood columns information based on current industry standards and construction practices many building design examples plus helpful study aids and references equally suited to classroom use or independent study simplified design of wood structures fifth edition is a superb resource for aspiring and practicing architects and engineers
