the physical sciences question bank csir net integrates disciplines like physics astronomy materials science and electronics depending on syllabus this resource provides previous year question pdfs answer keys and detailed solutions question sets organised by topic mechanics electromagnetism quantum thermodynamics solid state etc and model tests mirroring the net pattern parts a b c the bank emphasises analytical and application based problems in part c worth 4 marks each so that aspirants build reasoning skills rather than mere factual recall books tied to this pack incorporate concise notes worked examples and topic summaries aligned to the net syllabus regular practice through the bank enables students to become fluent in solving diverse mcq formats sharpen time management skills and internalise patterns of high frequency questions especially beneficial for aspirants seeking jrf lectureship in physical sciences

this book is helpful for all competitive exams

this best selling textbook for a second course in linear algebra is aimed at undergrad math majors and graduate students the novel approach taken here banishes determinants to the end of the book the text focuses on the central goal of linear algebra understanding the structure of linear operators on finite dimensional vector spaces the author has taken unusual care to motivate concepts and to simplify proofs a variety of interesting exercises in each chapter helps students understand and manipulate the objects of linear algebra the third edition contains major improvements and revisions throughout the book more than 300 new exercises have been added since the previous edition many new examples have been added to illustrate the key ideas of linear algebra new topics covered in the book include product spaces quotient spaces and dual spaces beautiful new formatting creates pages with an unusually pleasant appearance in both print and electronic versions no prerequisites are assumed other than the usual demand for suitable mathematical maturity thus the text starts by discussing vector spaces linear independence span basis and dimension the book then deals with linear maps eigenvalues and eigenvectors inner product spaces are introduced leading to the finite dimensional spectral theorem and its consequences generalized eigenvectors are then used to provide insight into the structure of a linear operator

we learned in school that matter exists in three forms solid liquid and gas as well as other more subtle things such as the fact that evaporation produces cold the science of the states of matter was born in the 19th century it has now grown enormously in two directions 1 the transitions have multiplied first between a solid and a solid particularly for metallurgists then for magnetism illustrated in france by louis neel and ferro electricity in addition the extraordinary phenomenon of superconductivity in certain metals appeared at the beginning of the 20th century and other superfluids were recognized later helium 4 helium 3 the matter constituting atomic nuclei and neutron stars there is now a real zoology of transitions but we know how to classify them based on landau's superb idea 2 our profound view of the mechanisms has evolved in particular the very universal properties of fluctuations near a critical point described by kadanoff's qualitative analysis and specified by an extraordinary theoretical tool the renormalization group without exaggerating we can say that our view of condensed matter has undergone two revolutions in the 20th century first the introduction of quantum physics in 1930 then the recognition of self similar structures and the resulting scaling laws around 1970
